```
      1
6 ) 6 8 9 4 2 1
    6
    0 8
```

1. Six divided by six is one. We write that at the top above the six.

2. We now want to find out if there is a remainder. We do this by multiplying six by the one.

3. The third stage is to subtract the six from the six in the way we normally do column subtraction.

4. We bring down the eight in order to allow us to start again with eight divided by six.

When we are dividing one number by another, there are three words to remember. The number being split up is called the dividend. The number of parts it is being split into is called the divisor. The answer is called the quotient.

÷	Divide
×	Multiply
−	Subtract
↓	Bring down

This number is called the divisor.

The answer which goes at the top is the quotient.

This number is the Dividend.

```
      1 1 4 9 0 6
6 ) 6 8 9 4 2 4
    6
    0 8
      6
      2 9
      2 4
        5 4
        5 4
          0 2
            0
            2 4
            2 4
              0
```

Ways of writing divide:

237 ÷ 16

$$\frac{237}{16}$$

16) 237
